Individual project proposal

I'm planning to design a VCR with following functions:

1. Play
2. Stop
3. Rewind
4. Forward
5. Record a TV channel
 - Instantly
 - Preprogram: using timer
6. Set clock: current time, time zone, day light saving
 - Manual
 - Auto: receive a signal from a channel and set the clock accordingly
7. Skip commercial mode during playback.

Right now, I am not sure how to work everything out, especially how to record and how to receive signal from a channel. Please give me some suggestions!

You should simulate the receiving of signal via keyboard input. The commercial skip might delete all 'c's from the input stream of characters.
